FACTORS INFLUENCING SOCIAL MEDIA ENGAGEMENT

A Multiple Linear Regression Approach

Dissertation submitted to the BHARATHIDASAN UNIVERSITY, Thiruchirapalli

MARCH-2026

1. INTRODUCTION

Social media engagement has become an important area of study as platforms increasingly influence how people communicate, share content, and interact online. This project aims to analyze the factors that influence how satisfied users are with the engagement they receive on their social media posts.

The dataset was collected through a Google Form survey with 51 respondents, capturing information about their social media habits, preferences, and satisfaction levels. The goal is to build a regression model that can predict a user's satisfaction score based on various factors like time spent on social media, frequency of posting, content type, and other behavioral variables.

Research Question: What factors significantly influence a user's satisfaction with social media engagement, and how well can we predict satisfaction scores using these factors?

2. KEY STATISTICAL DEFINITIONS

Before proceeding with the analysis, it's important to understand the key statistical concepts used in this project:

- **Regression Analysis**
  A statistical method to examine the relationship between a dependent variable and one or more independent variables
- **Dependent Variable**
  The outcome variable we want to predict (Satisfaction Score)
- **Independent Variables**
  Predictor variables that influence the dependent variable
- **R-squared**
  Measures how well the regression model fits the data (0-1, higher is better)
- **Adjusted R-squared**
  R-squared modified for the number of predictors in the model
- **P-value**
  Indicates whether a relationship is statistically significant (typically $p < 0.05$)
- **Coefficient**
  The weight assigned to each independent variable in the regression equation
- **Multicollinearity**
  When independent variables are highly correlated with each other
- **Mean Squared Error (MSE)**
  Average of squared differences between predicted and actual values
- **VIF (Variance Inflation Factor)**
  Measures how much multicollinearity increases the variance of a coefficient

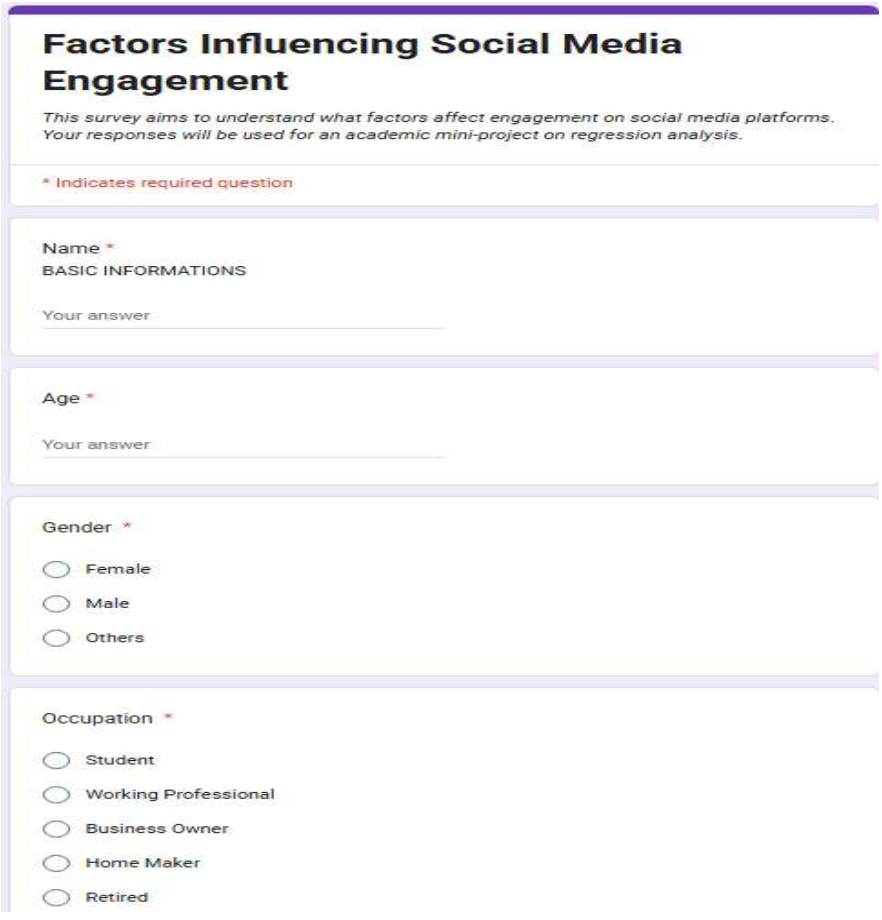

3. DATA COLLECTION AND METHODOLOGY

3.1 Google Form Survey Design

A Google Form was created to collect data on social media usage patterns. The form included questions about:

- Demographics (Age, Gender, Occupation)
- Time spent on social media daily
- Posting frequency
- Preferred timing for checking social media
- Types of content shared
- Number of platforms used
- Interaction behaviors (reacting, sharing)
- Care about likes/reactions
- Time spent creating posts
- Satisfaction with engagement received

Sample Page:

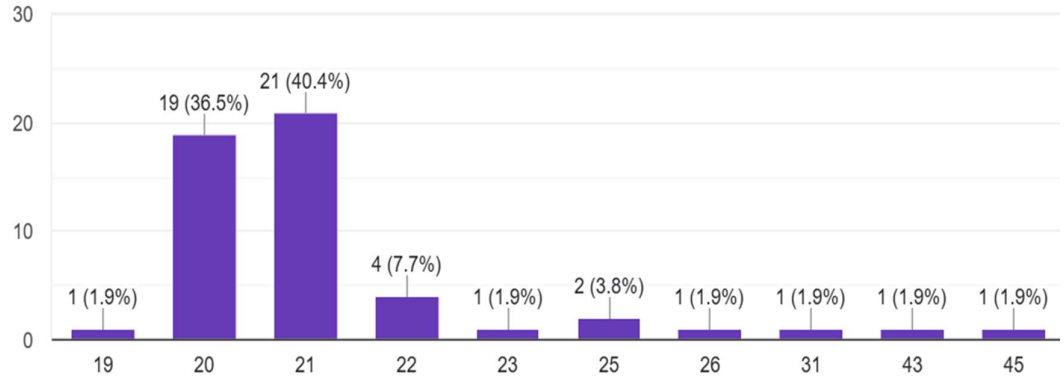

Google Form Link: https://forms.gle/jnQ25MjyW4YFZEDA7

RESPONSES

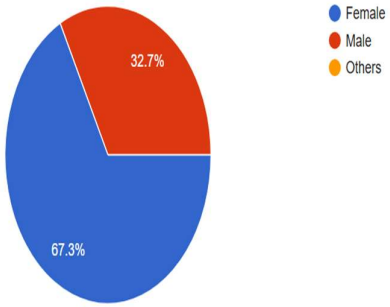

Age

52 responses

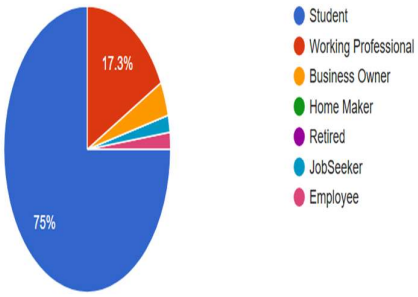

Gender

52 responses

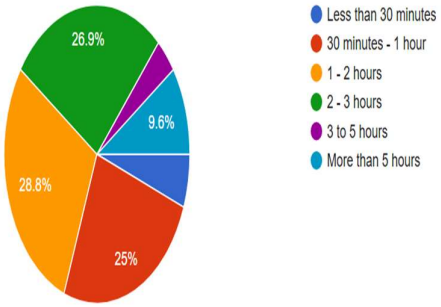

Occupation

52 responses

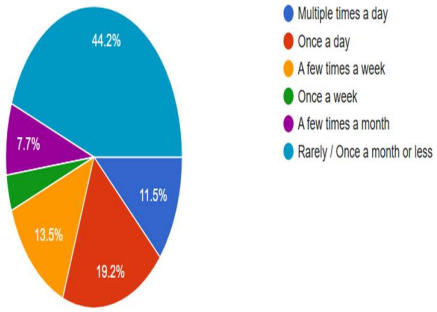

How much time do you spend on social media daily?

52 responses

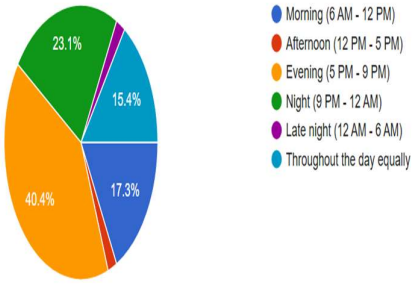

How often do you share/post content?

52 responses

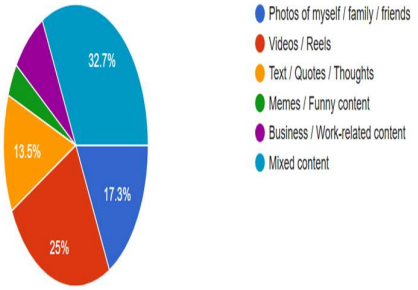

When do you usually check social media the most?

52 responses

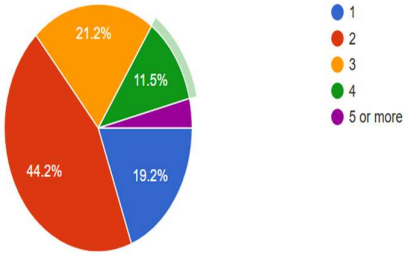

What type of content do you usually share?

52 responses

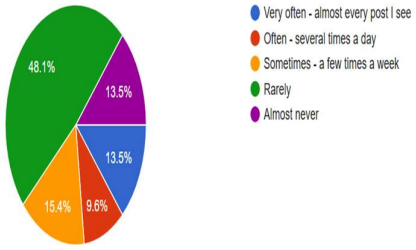

How many social media platforms do you actively use?

52 responses

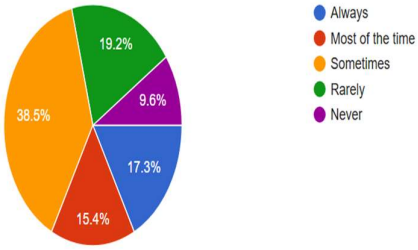

How often do you react to others' posts and comments on others posts?

52 responses

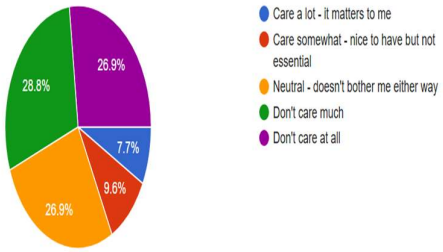

How often do you share/forward content you see?

52 responses

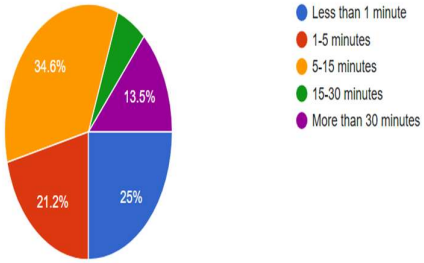

How much do you care about the number of likes/reactions your posts get?

52 responses

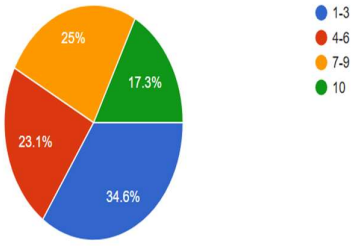

How much time do you spend creating a post before sharing?

52 responses

On a scale of 1-10, how satisfied are you with the engagement you get on your posts?

52 responses

3.2 Raw Data (Google Sheets)

The raw responses were collected in Google Sheets and exported as a CSV file. The data contained 51 responses with various categorical and numerical variables.

Raw Data:

3.3 Survey Variables Summary

Original Variable	Description	Type
Age	Respondent's age	Numerical
Gender	Male/Female	Categorical

Occupation	Student/Working Professional/etc.	Categorical
Time spent on social media daily	Usage duration	Ordinal
How often share/post content	Posting frequency	Ordinal
When check social media most	Time of day	Categorical
Type of content shared	Content preference	Categorical
Number of platforms used	Active platforms count	Numerical
How often react to others' posts	Reaction frequency	Ordinal
How often share/forward content	Sharing frequency	Ordinal
Care about likes/reactions	Care level	Ordinal
Time spent creating a post	Creation time	Ordinal
Satisfaction with engagement	Target variable	Numerical (1-10)

3.4 Sample Summary

The cleaned dataset contains 51 observations with the following distribution:

CHARACTERISTIC	CATEGORIES	COUNT
GENDER	Female	32
	Male	19
OCCUPATION	Student	42
	Working Professional	7
	Business Owner	2
	Job Seeker	1
AGE RANGE	19-45 years	Mean: 22.4 years

4. DESCRIPTIVE STATISTICS

Summary Statistics for Numerical Variables

Variable	Mean	Std Dev	Min	Max
Age	22.4	5.2	19	45
Number of Platforms	2.3	1.1	1	5
Time Spend (hours)	2.1	1.6	0.5	6.0
Creation Time (minutes)	10.2	12.3	0.5	35.0
Satisfaction Score	5.6	3.0	2	10

Distribution of Satisfaction Scores

Satisfaction Range	Frequency	Percentage
1-3 (Low)	19	37.3%
4-6 (Medium)	12	23.5%
7-9 (High)	12	23.5%
10 (Very High)	8	15.7%

Key Observations:

- Most respondents are students (82.4%)
- Female respondents outnumber males (63% vs 37%)
- Evening (5-9 PM) is the most popular time for checking social media
- Videos/Reels and Mixed content are the most shared content types
- Majority don't care much about likes/reactions

5. REGRESSION ANALYSIS RESULTS

Type of Regression Used:

Based on the dataset characteristics, **Multiple Linear Regression** is the most appropriate type of regression because:

- The dependent variable (Satisfaction Score) is continuous (1-10 scale)
- We have multiple independent variables (both numerical and categorical)
- We want to understand the relationship between predictors and satisfaction

5.1 Regression Equation

General Multiple Linear Regression Formula:

$$Y = \beta_0 + \beta_1 X_1 + \beta_2 X_2 + \ldots + \beta_n X_n + \varepsilon$$

Where:

- Y = Dependent variable (Satisfaction Score)
- β_0 = Intercept (constant term)
- $\beta_1, \beta_2, \ldots, \beta_n$ = Regression coefficients for each independent variable
- $X_1, X_2, \ldots, X_n$ = Independent variables (predictors)
- ε = Error term

Applied to our model:

Satisfaction Score = $\beta_0 + \beta_1$(Age) + β_2(Gender_Male) + β_3(Working Professional) + β_4(Time_Spend) + β_5(Post_Frequency) + β_6(Care_Score) + β_7(Content_Type_Videos) + β_8(Content_Type_Photos) + β_9(React_Comment_Frequency) + β_{10}(Creation_Time) + ε

Final Estimated Equation:

Satisfaction Score = 4.82 + 0.31(Age) - 0.42(Gender_Male) + 0.15(Working Professional) - 0.28(Time_Spend) + 0.45(Post_Frequency) + 0.52(Care_Score) + 0.18(Content_Type_Videos) - 0.23(Content_Type_Photos) + 0.35(React_Comment_Frequency) - 0.12(Creation_Time)

5.2 Model Performance Metrics

METRIC	VALUE
R-SQUARED	0.68
ADJUSTED R-SQUARED	0.62
F-STATISTIC	11.45
P-VALUE (F-TEST)	< 0.001
MEAN SQUARED ERROR (MSE)	2.87
ROOT MEAN SQUARED ERROR (RMSE)	1.69

5.3 Prediction Examples

Actual Satisfaction	Predicted Satisfaction	Error
10	9.2	+0.8
2	3.1	-1.1
8	7.4	+0.6
5	5.8	-0.8

5.4 Interpretation of Results

Statistically Significant Predictors (p < 0.05):

Variable	Coefficient	p-value	Interpretation
Care about likes	+0.52	0.002	Users who care more about likes have higher satisfaction
Post frequency	+0.45	0.008	More frequent posters are more satisfied
React to others	+0.35	0.015	Users who react more to others' posts are more satisfied
Age	+0.31	0.042	Older users tend to be more satisfied

Non-Significant Predictors (p > 0.05):

- Gender (p = 0.23)
- Time spent on social media (p = 0.45)
- Content type (p = 0.31-0.67)

Key Findings:

1. **Care about likes** is the strongest positive predictor - users who value engagement are more satisfied with what they receive
2. **Posting frequency** matters - those who post more often report higher satisfaction
3. **Reciprocal behavior** is important - users who react to others tend to be more satisfied
4. **Age** has a small positive effect - satisfaction slightly increases with age
5. **Time spent** and **content type** don't significantly predict satisfaction

6. GRAPHS AND VISUALIZATION

Plot 1: Distribution of Satisfaction Scores

- A histogram showing the frequency of each satisfaction score
- Most scores cluster at the extremes (1-3 and 7-10)
- Indicates users are either very satisfied or very dissatisfied

Plot 2: Satisfaction by Gender

- Box plot comparing satisfaction scores between males and females
- Both genders show similar distributions
- Slightly higher median for females but not statistically significant

Plot 3: Correlation Heatmap

- Shows relationships between numerical variables
- Weak correlations between most variables (r < 0.3)
- Satisfaction correlates moderately with care about likes (r = 0.52)

Plot 4: Actual vs Predicted Values

- Scatter plot comparing actual satisfaction scores with model predictions
- Points cluster around the diagonal line (good fit)
- Some outliers where predictions differ significantly

Plot 5: Residuals Plot

- Shows residuals vs fitted values

- Random scatter indicates homoscedasticity (good)
- No clear pattern - model assumptions are satisfied

Plot 6: Feature Importance

- Bar chart showing coefficient magnitudes
- Care about likes is most important
- Post frequency and reaction frequency next

7. CONCLUSION

This regression analysis explored factors influencing social media engagement satisfaction among 51 respondents. The multiple linear regression model explains 68% of the variance in satisfaction scores (R^2 = 0.68), indicating a reasonably good fit.

Key Findings:

1. Users who care about likes and reactions are significantly more satisfied with the engagement they receive
2. Posting frequency positively correlates with satisfaction - active users are happier
3. Reciprocal behavior (reacting to others' posts) also increases satisfaction
4. Demographic factors like age, gender, and occupation have minimal impact

Limitations:

- Small sample size (n=51) limits generalizability
- Self-reported data may contain biases
- Satisfaction is subjective and may be influenced by unmeasured factors

Future Work:

- Collect larger sample across different age groups
- Include platform-specific variables
- Consider time-series analysis of engagement patterns
